PROJECT PLAN

Portal Espiritual – Landing Page

Spiritual Services Booking Website

Client: [Client Name]
Date: March 2026
Version: 1.0

1. Project Overview

Build a single-page spiritual services landing page accessible from one Instagram bio link. The site showcases three services, allows appointment booking with a pre-session form, and collects payment before confirming. The design evokes a clean galactic portal: deep indigo, violet, and subtle gold accents.

2. Tech Stack

The following technologies were chosen for speed of development, low cost, and reliability for a solo-operator business based in Mexico.

Layer	Technology	Why
Framework	Next.js 14 (App Router)	Fast, SEO-friendly, deploys easily to Vercel
Hosting	Vercel (Free tier)	Zero-config deploy from GitHub, global CDN, custom domain
Styling	Tailwind CSS	Rapid styling, perfect for the galactic gradient design
Scheduling	Cal.com (Cloud)	Free tier, Google Calendar sync, embeddable, prevents double bookings
Payments	Stripe	Supports MXN, handles cards + OXXO, Stripe Checkout for simple integration
Email	Cal.com built-in	Automatic booking confirmations, no extra service needed
Language	TypeScript	Catches errors early, great for learning

3. Page Structure

The entire site is a single page with smooth scroll navigation. Mobile-first design since most traffic comes from Instagram.

3.1 Hero Section (Services Portal)

The first thing visitors see. Shows all three services as clear cards with booking buttons.

- Editable main title and subtitle
- Three service cards displayed in a grid (1 column on mobile, 3 on desktop)
- Each card shows: service name, duration, launch price in MXN, short description, and a “Reservar” button

Service	Duration	Price (MXN)	Description
🔮 Lectura de Cartas	30 min	$500	Card divination to interpret the universe’s message as guidance for you right now.
🌌 Divinación Akáshica	30 min	$500	Enter your Akashic records to receive messages from past lives, ancestors, spiritual team, and higher self.
🤍 Uno-a-Uno	60 min	$800	Open one-on-one space for conscious conversation with connection to your spiritual team.

3.2 About Me Section

Personal connection section with photo and first-person text.

- Desktop: photo on one side, text on the other (flex row)
- Mobile: photo on top, text below (flex column)
- Placeholder photo slot – client provides their own image

3.3 Footer

Simple footer with Instagram link and optional contact info. Clean and minimal.

4. Booking Flow (User Journey)

Maximum 3 clicks from landing to confirmed booking. Here is the complete flow:

1. User clicks “Reservar” on a service card
2. A modal or embedded Cal.com widget opens showing available time slots (synced with Google Calendar)
3. User selects a date and time
4. User fills in the pre-session form: Name, Email, Intention/Question
5. User is redirected to Stripe Checkout to pay the service fee in MXN
6. After payment, booking is confirmed – automatic email sent to both client and practitioner

Key rule: No booking is confirmed without payment. Stripe Checkout handles this automatically – if payment fails, the time slot is released.

5. Integration Details

5.1 Cal.com Setup

- Create a Cal.com account (free cloud tier)
- Create 3 event types: Lectura de Cartas (30 min), Divinación Akáshica (30 min), Uno-a-Uno (60 min)
- Connect Google Calendar so availability is always synced
- Add custom fields for Name, Email, and Intención/Pregunta
- Enable Stripe integration in Cal.com for required payment before booking
- Embed Cal.com using their React component (@calcom/embed-react) in the Next.js page

5.2 Stripe Setup

Account creation: Your friend needs to create a Stripe account at stripe.com. Choose Mexico as the country so MXN is the default currency.

- Stripe integrates directly with Cal.com – no custom payment code needed
- Supports credit/debit cards and OXXO payments (important for Mexican customers)
- Stripe handles receipts and payment confirmations automatically
- Test with Stripe’s test mode before going live

5.3 Google Calendar Sync

Cal.com connects to Google Calendar via OAuth. Once connected, any personal events on the calendar will automatically block those time slots. New bookings are added as Google Calendar events with the client's info.

6. Visual Design Specifications

The design concept is a "clean galactic portal" – evoking universe, space, silence, and consciousness.

6.1 Color Palette

Role	Color	Usage
Primary	Deep Indigo #0F0A2E	Background base, headings
Secondary	Violet #2D1B69	Card backgrounds, gradients
Accent	Soft Gold #C9A84C	Buttons, highlights, dividers (very subtle)
Text	Soft White #E8E0F3	All body text on dark backgrounds
Background Gradient	Black → Indigo → Violet	Full-page gradient behind star field

6.2 Typography

- Headings: Inter or Space Grotesk (clean, modern)
- Body: Inter (highly legible, Google Fonts, free)
- All text in Spanish

6.3 Animated Star Field Background

The background is the heart of the visual identity. A living, breathing star field over a pure black background creates an immersive portal effect. All animations must be built with pure CSS and minimal JavaScript — no heavy canvas libraries — to keep the page fast on mobile (Instagram traffic).

Base Layer

- Solid black background (#000000 or near-black #050510) as the canvas
- Subtle radial gradient overlay in the center (very faint deep indigo/violet glow) to add depth without losing the dark sky feel

Star Layer 1 — Twinkling Stars

- 200–300 small white dots (1–3px) randomly placed across the viewport using CSS

- Each star gets a CSS @keyframes animation cycling opacity from 0.2 to 1.0 and back ("twinkle")
- Random animation-delay per star (0s to 8s) so they don't all twinkle in sync
- Animation duration varies between 3s and 7s per star for natural randomness
- Some stars (~15%) include a brief "off" phase where they fade to opacity 0 before returning, simulating stars turning on and off

Star Layer 2 — Shooting Stars

- One shooting star every ~30 seconds, triggered by a JavaScript setInterval
- Each shooting star is a small bright line (white/gold, ~80–120px trail) that moves diagonally across the screen
- Random starting position (top half of screen) and angle for each occurrence
- CSS animation: translate + opacity fade, duration ~1 second, ease-in-out
- Element is removed from DOM after animation ends to prevent memory buildup

Star Layer 3 — Slow Celestial Rotation

- All twinkling stars are wrapped in a single container div
- The container gets a CSS transform: rotate animation, completing one full 360° rotation every 600–900 seconds (~10–15 minutes)
- Simulates the effect of watching the night sky from Earth — barely perceptible but deeply immersive
- Container is slightly oversized (120% width and height) so rotation doesn't reveal edges
- animation-timing-function: linear (constant speed, no easing)

Performance Requirements

- **No heavy libraries.** Pure CSS animations + minimal JS. No canvas, no particles.js, no Three.js
- **Mobile-first.** Reduce star count on mobile (100–150 instead of 300) using a media query or JS check
- **GPU-accelerated.** Use only transform and opacity for animations (triggers GPU compositing, avoids layout reflows)
- **No images.** Everything is CSS + HTML elements. Zero image downloads for the background
- **Respect prefers-reduced-motion.** If the user has motion sensitivity enabled in their OS, disable all animations and show a static star field

Technical Implementation Summary

The StarField.tsx React component generates all star positions on mount using a seeded random function. Stars are rendered as absolutely positioned div elements with border-radius: 50%. Three CSS @keyframes are defined: "twinkle" (smooth opacity pulse), "twinkle-off" (includes a fully transparent phase), and "shooting-star" (diagonal translate with fade). A useEffect hook sets up the 30-second shooting star interval. The entire star

container has a single slow rotation animation applied via CSS transform: rotate(360deg) with a duration of ~600s and linear timing.

6.4 Service Cards

- Semi-transparent glass-morphism style (backdrop-blur + subtle border)
- Soft glow on hover
- Gold accent on the “Reservar” button
- Each card has a subtle emoji/icon at the top

7. Development Phases & Timeline

Estimated total time: 1–2 weeks for a working MVP.

Phase	Tasks	Details	Est. Time
1	Project Setup	Create Next.js project, configure Tailwind, deploy to Vercel, connect GitHub repo	1 day
2	Landing Page UI	Build hero section, service cards, about me section, footer. Mobile-first responsive design with galactic theme.	3–4 days
3	Cal.com Integration	Set up Cal.com account, create 3 event types, connect Google Calendar, add custom form fields, embed in Next.js.	1–2 days
4	Stripe Integration	Create Stripe account (Mexico/MXN), connect to Cal.com, configure prices, test payments.	1 day
5	Testing & Polish	Test full booking flow on mobile, fix responsive issues, test payment flow with Stripe test mode.	1–2 days
6	Launch	Connect custom domain (optional), switch Stripe to live mode, add link to Instagram bio.	1 day

8. Project File Structure

Clean Next.js App Router structure. Everything in one page since it's a single-page site.

```
portal-espiritual/
├── app/
│   ├── page.tsx          ← Main landing page
│   ├── layout.tsx        ← Root layout (fonts, metadata)
│   └── globals.css       ← Tailwind + custom star animations
├── components/
│   ├── Hero.tsx          ← Title + service cards
│   ├── ServiceCard.tsx   ← Reusable card component
│   ├── AboutMe.tsx       ← Photo + bio section
│   ├── BookingModal.tsx  ← Cal.com embed wrapper
│   ├── StarField.tsx     ← Animated background

├── public/
│   └── about-photo.jpg   ← Client's photo
├── tailwind.config.ts
├── package.json
└── next.config.js
```

9. Estimated Costs

Monthly running costs for the client after launch:

Service	Cost	Notes
Vercel Hosting	Free	Hobby plan is sufficient for this traffic level
Cal.com	Free	Free tier supports 1 user with unlimited event types
Stripe	3.6% + $3 MXN per transaction	Standard Mexico rate, no monthly fee
Custom Domain (optional)	~$200 MXN/year	From Namecheap, GoDaddy, etc.
Total Monthly (excl. Stripe fees)	$0 – $17 MXN/mo	Essentially free to run

10. Revenue Model

This project has two revenue streams: presential sessions (Phase 1, launching now) and pre-recorded courses (Phase 2, planned for the future).

10.1 Phase 1 – Presential Sessions (Live)

The three services described in this plan (Lectura de Cartas, Divinación Akáshica, and Uno-a-Uno) are live, one-on-one sessions booked through Cal.com and paid via Stripe.

- **Developer commission: 10%** of each presential session booked through the website
- Commission is calculated on the gross session price before Stripe fees
- Example: Lectura de Cartas at $500 MXN → $50 MXN developer commission per session
- Example: Uno-a-Uno at $800 MXN → $80 MXN developer commission per session
- Stripe's reporting dashboard can be used to track bookings and calculate monthly commissions

10.2 Phase 2 – Pre-Recorded Courses (Future)

A future courses section will be added to the site where users can purchase access to pre-recorded educational content on spiritual topics. This section is not part of the initial launch but should be planned for in the site architecture.

- **Developer commission: 40%** of each course sale (higher share reflects platform development and maintenance)
- Courses will consist of pre-recorded video sessions that users can access after one-time payment
- Technical approach TBD – likely Stripe for payments + a video hosting solution (e.g., Vimeo OTT, or a custom gated content section in Next.js)
- A new "Cursos" section will be added to the landing page when ready

10.3 Revenue Summary Table

Revenue Stream	Dev Commission	Client Share	Status
Presential Sessions	**10%**	90%	Phase 1 (Now)
Pre-Recorded Courses	**40%**	60%	Phase 2 (Future)

Note: Both commission percentages are calculated on gross sale price before Stripe processing fees (3.6% + $3 MXN). Stripe fees are absorbed by the client.

11. Pre-Development Checklist

Things the client needs to do before we start coding:

1. Create a Stripe account at stripe.com (select Mexico as country)
2. Create a Cal.com account at cal.com
3. Connect Google Calendar to Cal.com
4. Provide their “About Me” photo (high quality, square or portrait)
5. Provide the “About Me” text in Spanish (first person)
6. Provide the main title and subtitle for the hero section
7. Confirm the 3 service descriptions, durations, and prices
8. Decide on a domain name (optional – can use Vercel’s free subdomain initially)

12. Next Steps

Once the client provides the items from the checklist above, we proceed in this order:

1. Initialize Next.js project with Tailwind and deploy to Vercel
2. Build the galactic-themed landing page UI (mobile-first)
3. Embed Cal.com scheduling widget for each service
4. Connect Stripe payments through Cal.com
5. Test the complete booking + payment flow
6. Go live and add link to Instagram bio
