1. Introduction

1.1 Purpose

This Software Requirements Specification (SRS) defines the complete functional and non-functional requirements for the Portal Espiritual web application. It serves as the binding technical contract between the client and the developer, ensuring both parties have a shared understanding of what will be built, how it will behave, and what constitutes completion.

1.2 Scope

The system is a single-page landing website designed for a spiritual services practitioner. It will be accessible via a single link placed in an Instagram bio. The system encompasses two development phases:

- **Phase 1 (Current Scope):** Live presential sessions – service showcase, appointment booking, pre-session form, and payment processing.
- **Phase 2 (Future Scope):** Pre-recorded courses – a courses section with video content, one-time purchase, and gated access.

This SRS covers Phase 1 in full detail and Phase 2 at a high level for architectural planning.

1.3 Definitions & Acronyms

Term	Definition
SRS	Software Requirements Specification
MXN	Mexican Peso (currency)

Cal.com	Open-source scheduling platform used for appointment booking
Stripe	Payment processing platform supporting MXN transactions
MVP	Minimum Viable Product – the initial working version
Presential Session	A live, one-on-one spiritual service session (virtual or in-person)
Glass-morphism	UI design style using semi-transparent backgrounds with backdrop blur
Instagram Bio Link	The single clickable URL allowed in an Instagram profile

1.4 References

- Stripe Mexico documentation: https://stripe.com/mx
- Next.js App Router documentation: https://nextjs.org/docs

2. Overall Description

2.1 Product Perspective

Portal Espiritual is a standalone web application. It integrates with three external services: Cal.com for scheduling, Google Calendar for availability sync, and Stripe for payment processing. The site is hosted on Vercel and accessed primarily through mobile browsers via Instagram.

2.2 User Classes

User Class	Description	Frequency of Use
Visitor / Client	A person arriving from Instagram who wants to learn about and book a spiritual session	Occasional – visits to browse services and book appointments
Practitioner (Admin)	The spiritual services provider who manages availability, receives bookings, and collects payments	Daily – checks calendar, reviews bookings and form submissions
Developer	Maintains the website, implements updates, and manages integrations	As needed – maintenance, bug fixes, Phase 2 development

2.3 Operating Environment

- Web browsers: Chrome, Safari, Firefox, Edge (latest 2 versions)
- Primary device: Mobile phones (iPhone, Android) via Instagram in-app browser
- Secondary device: Desktop/laptop browsers
- Hosting: Vercel (serverless, global CDN)
- Runtime: Node.js 18+ (Next.js server-side)

2.4 Constraints

- All user-facing text must be in Spanish
- All prices must be displayed and processed in MXN (Mexican Pesos)
- The site must function correctly in the Instagram in-app browser (WebView)
- Payment must be completed before a booking is confirmed (no pay-later)
- The practitioner is a single user – no multi-practitioner support required
- No user accounts or authentication for visitors (booking is form-based)

2.5 Assumptions & Dependencies

- The client will create and maintain their own Stripe and Cal.com accounts
- The client's Google Calendar will remain connected to Cal.com for availability
- Vercel's free tier will be sufficient for the expected traffic volume
- Cal.com's free tier supports the required features (embed, Stripe integration, custom fields)
- The client will provide all content: about-me photo, bio text, hero title/subtitle

3. Functional Requirements

Each requirement is identified with a unique ID, description, priority (High / Medium / Low), and acceptance criteria.

3.1 Landing Page Display

ID	Requirement	Priority	Acceptance Criteria
FR-001	The system shall display a single-page landing site with smooth scroll navigation between sections.	**High**	Page loads with all sections visible via scroll
FR-002	The hero section shall display an editable main title and subtitle.	**High**	Title and subtitle render from configurable constants or CMS

FR-003	The hero section shall display exactly three service cards, each showing: service name, emoji/icon, duration, launch price in MXN, short description, and a “Reservar” button.	**High**	All three cards visible on initial viewport (desktop) or via scroll (mobile)
FR-004	Service cards shall display in a 3-column grid on desktop (≥1024px) and single-column stack on mobile (<1024px).	**High**	Responsive layout verified on 375px and 1440px viewports
FR-005	The “About Me” section shall display a personal photo and first-person text. Desktop: side-by-side layout. Mobile: photo above, text below.	**High**	Layout switches at 1024px breakpoint
FR-006	The footer shall display an Instagram link and optional contact information.	**Medium**	Footer renders at bottom of page with clickable IG link

3.2 Booking System

ID	Requirement	Priority	Acceptance Criteria
FR-007	Clicking “Reservar” on any service card shall open the Cal.com scheduling widget for that specific service’s event type.	**High**	Each button opens the correct Cal.com event type
FR-008	The scheduling widget shall display available time slots synced with the practitioner’s Google Calendar.	**High**	Blocked calendar events hide corresponding time slots
FR-009	The system shall prevent double bookings. A time slot booked for any service shall not be available for other services.	**High**	Booking service A blocks same slot in services B and C
FR-010	The booking flow shall collect three required fields before confirming: Name, Email, and Intention/Question (Intención o pregunta).	**High**	Form validation rejects empty required fields
FR-011	The complete booking flow (from clicking “Reservar” to payment confirmation) shall require no more than 3 user interactions/screens.	**High**	UX walkthrough confirms ≤3 steps
FR-012	Upon successful booking, the system shall send an automatic confirmation email to both the client and the practitioner.	**High**	Test booking triggers emails to both parties

3.3 Payment System

ID	Requirement	Priority	Acceptance Criteria

FR-013	Payment shall be mandatory before a booking is confirmed. No booking shall be finalized without successful payment.	**High**	Failed/abandoned payment releases the time slot
FR-014	All payments shall be processed in MXN through Stripe, integrated via Cal.com's native Stripe connection.	**High**	Stripe dashboard shows MXN transactions
FR-015	The system shall charge the correct price per service: Lectura de Cartas $500 MXN, Divinación Akáshica $500 MXN, Uno-a-Uno $800 MXN.	**High**	Stripe charges match configured service prices
FR-016	The system shall support credit/debit card payments. OXXO payment support is desirable.	**High**	Test card payment succeeds in Stripe test mode
FR-017	Stripe shall automatically generate payment receipts for clients.	**Medium**	Client receives email receipt from Stripe after payment

3.4 Service Definitions

The following services shall be available at launch:

Service Name	Duration	Price (MXN)	Description (Spanish)
🔮 Lectura de Cartas	30 min	$500	Divinación con cartas para interpretar el mensaje del universo que te sirva de guía para ti en este momento.
🌌 Divinación Akáshica	30 min	$500	Entraremos en tu Akasha, los registros de tu alma para deliberar el mensaje que en este momento sea de asistencia para ti, conectando a tus vidas pasadas, ancestros, equipo espiritual y ser superior.
🤍 Uno-a-Uno	60 min	$800	Espacio uno a uno para hablar libremente de cualquier tema. Una conversación consciente donde se abre la posibilidad de conectar con tu equipo espiritual.

4. Non-Functional Requirements

4.1 Performance

ID	Requirement	Target

NFR-001	Initial page load time (First Contentful Paint) on 4G mobile connection	< 2 seconds
NFR-002	Time to Interactive (TTI) on mobile	< 3.5 seconds
NFR-003	Lighthouse Performance score	≥ 90
NFR-004	Star field animations shall maintain 60fps on mid-range mobile devices without causing frame drops	60 fps sustained
NFR-005	Total page weight (HTML + CSS + JS, excluding external Cal.com embed)	< 500 KB

4.2 Compatibility

- The site shall render correctly in the Instagram in-app browser on both iOS and Android.
- The site shall be fully functional in Chrome, Safari, Firefox, and Edge (latest 2 versions).
- All animations shall gracefully degrade – if CSS animations are not supported, the page shall display a static dark background with no broken elements.

4.3 Accessibility

- The site shall respect the prefers-reduced-motion media query. When enabled, all animations shall be disabled and a static star field displayed.
- All interactive elements (buttons, links) shall be keyboard-navigable.
- Color contrast ratio between text and background shall meet WCAG AA standards (≥4.5:1 for normal text).
- All images shall include descriptive alt text in Spanish.

4.4 Security

- All pages shall be served over HTTPS (enforced by Vercel).
- No sensitive payment data shall be handled by the application – all payment processing occurs within Stripe's hosted environment.
- Form inputs shall be sanitized to prevent XSS attacks.
- The Cal.com embed shall be loaded from Cal.com's official CDN.

4.5 Maintainability

- Service names, descriptions, prices, and durations shall be defined as constants in a single configuration file for easy updates without code changes.
- The hero title and subtitle shall be editable from the same configuration file.
- The codebase shall use TypeScript for type safety.

- Components shall follow a modular architecture (one component per file) as defined in the project file structure.

4.6 Scalability

The architecture shall accommodate Phase 2 (courses section) without requiring a rewrite. Specifically:

- The Next.js App Router structure shall allow adding new page sections or routes.
- The Stripe integration shall support adding new product types (course purchases) alongside session payments.
- The site shall be designed so a “Cursos” navigation item can be added to the hero or a new section without breaking existing functionality.

5. User Interface Requirements

5.1 Design Concept

The visual identity is a “clean galactic portal” – elegant, minimalistic, and spiritual. The design must evoke feelings of universe, space, silence, and consciousness while maintaining a modern, professional aesthetic.

5.2 Color Palette

Role	Color	CSS Value
Background	Pure/near black	#000000 or #050510
Gradient glow	Deep indigo	radial-gradient center, very faint #0F0A2E
Card surfaces	Semi-transparent violet	rgba(45, 27, 105, 0.3) + backdrop-blur
Primary accent	Soft gold	#C9A84C
Body text	Soft white	#E8E0F3
Heading text	Pure white	#FFFFFF

5.3 Typography

- Headings: Inter or Space Grotesk (Google Fonts)
- Body text: Inter (Google Fonts)
- All text in Spanish
- Minimum body font size: 16px on mobile

5.4 Animated Star Field Background

The background is the defining visual element. It is built entirely with CSS and minimal JavaScript:

Twinkling Stars

- 200–300 white dots (1–3px) randomly placed across the viewport
- CSS @keyframes animation cycling opacity between 0.2 and 1.0
- Random animation-delay (0–8s) and duration (3–7s) per star
- ~15% of stars include a fully transparent phase (opacity 0) simulating on/off behavior

Shooting Stars

- One shooting star triggered every ~30 seconds via JavaScript setInterval
- Bright white/gold line (~80–120px trail) moving diagonally across the screen
- Random starting position (top half of screen) and slight angle variation
- CSS animation: translate + opacity fade, ~1 second duration, ease-in-out
- DOM element removed after animation completes (onAnimationEnd) to prevent memory buildup

Celestial Rotation

- All twinkling stars wrapped in a single container div (120% of viewport width/height to prevent edge visibility)
- CSS transform: rotate(360deg) animation with duration of 600–900 seconds (~10–15 minutes per full rotation)
- animation-timing-function: linear (constant speed)
- Simulates the slow rotation of the night sky as observed from Earth

Performance Constraints

- No canvas libraries, no particles.js, no Three.js – pure CSS + minimal JS only
- Reduce star count to 100–150 on mobile devices (< 768px)
- Only animate transform and opacity properties (GPU-composited, no layout reflows)
- Zero background images – all visual effects generated by CSS/HTML elements
- Must respect prefers-reduced-motion: show static star field when enabled

5.5 Service Cards

- Glass-morphism style: semi-transparent background + backdrop-blur + subtle 1px border
- Soft glow effect on hover (box-shadow transition)
- Gold accent ("Reservar" button background)
- Emoji/icon at the top of each card
- Smooth hover transition (0.3s ease)

5.6 Responsive Breakpoints

Breakpoint	Target	Layout Changes
< 768px	Mobile phones	Single column cards, photo above text in About Me, reduced star count
768px – 1023px	Tablets	2-column card grid, side-by-side About Me
≥ 1024px	Desktop	3-column card grid, side-by-side About Me, full star count

6. External Interface Requirements

6.1 Cal.com Integration

Attribute	Specification
Integration method	@calcom/embed-react npm package, embedded as a modal/popup per service
Event types	3 event types matching the defined services (30min, 30min, 60min)
Custom fields	Name (required), Email (required), Intención o pregunta (required, textarea)
Calendar sync	Google Calendar connected via OAuth for real-time availability
Payment	Stripe connected via Cal.com's native integration; payment required before confirmation
Notifications	Cal.com sends automatic confirmation and reminder emails to both parties

6.2 Stripe Integration

Attribute	Specification
Account region	Mexico
Currency	MXN (Mexican Pesos)

Payment methods	Credit/debit cards (required), OXXO (desirable)
Integration path	Via Cal.com's native Stripe connection (no custom Stripe code required for Phase 1)
Fee structure	3.6% + $3 MXN per transaction (standard Mexico rate)

6.3 Google Calendar

- Connected to Cal.com via OAuth
- Personal events on the calendar automatically block booking slots
- New bookings automatically appear as Google Calendar events

7. Revenue Model

7.1 Phase 1 – Presential Sessions

Developer commission: 10% of each presential session booked through the website.

- Commission calculated on gross session price before Stripe fees
- Lectura de Cartas ($500 MXN) → $50 MXN developer commission
- Divinación Akáshica ($500 MXN) → $50 MXN developer commission
- Uno-a-Uno ($800 MXN) → $80 MXN developer commission
- Stripe reporting dashboard used for monthly commission tracking

7.2 Phase 2 – Pre-Recorded Courses (Future)

Developer commission: 40% of each course sale.

- Pre-recorded video sessions available for one-time purchase
- Higher commission reflects platform development and ongoing maintenance
- Technical implementation TBD (Stripe payments + video hosting solution)

7.3 Revenue Split Summary

Revenue Stream	Developer	Client	Status
Presential Sessions	**10%**	90%	Phase 1 (Now)
Pre-Recorded Courses	**40%**	60%	Phase 2 (Future)

Note: Both commission percentages are calculated on gross sale price before Stripe processing fees (3.6% + $3 MXN). Stripe fees are absorbed by the client.

8. Phase 2 – Courses Section (High-Level)

This section outlines the planned Phase 2 expansion. Detailed requirements will be defined in a separate SRS addendum when development begins.

8.1 Concept

A new “Cursos” section will be added to the landing page showcasing pre-recorded educational content on spiritual topics. Users will be able to purchase course access with a one-time payment and watch content at their own pace.

8.2 Anticipated Requirements

- Course catalog display with title, description, price, and preview/thumbnail
- One-time Stripe payment per course (no subscriptions)
- Gated video content accessible only after purchase
- Video hosting via external service (e.g., Vimeo OTT, Bunny Stream, or self-hosted)
- Purchase history or access verification (likely requires basic user authentication)
- Same visual design language as Phase 1 (galactic portal theme)

8.3 Architectural Considerations

- Phase 1 shall use Next.js App Router which supports adding new routes (/cursos) without restructuring
- Stripe product catalog can be extended to include course products alongside session payments
- User authentication may be required for Phase 2 (e.g., NextAuth.js with email magic links)
- Video content should be hosted externally to avoid bandwidth costs on Vercel

9. Testing & Acceptance Criteria

9.1 Testing Strategy

Testing shall be performed across the following areas before the site goes live:

Test Type	Description	Method

Functional	Verify all booking, payment, and display requirements from Section 3	Manual walkthrough
Payment	End-to-end payment flow using Stripe test mode with test card numbers	Stripe test mode
Responsive	Verify layout on mobile (375px), tablet (768px), and desktop (1440px)	Browser DevTools
Cross-browser	Test on Chrome, Safari, Firefox, and Instagram in-app browser	Real devices
Performance	Lighthouse audit targeting ≥90 performance score	Chrome Lighthouse
Animation	Verify star field runs at 60fps on mid-range mobile, and respects prefers-reduced-motion	Performance profiler
Double booking	Attempt to book two services at the same time slot simultaneously	Concurrent test

9.2 Acceptance Criteria for Launch

The site shall be considered ready for launch when all of the following are met:

1. All High-priority functional requirements (FR-001 through FR-016) pass their acceptance criteria
2. Payment flow succeeds end-to-end in Stripe live mode with a real $1 MXN test charge
3. Lighthouse performance score ≥ 90 on mobile
4. Site renders correctly in the Instagram in-app browser on both iOS and Android
5. Confirmation emails are received by both client and practitioner after a test booking
6. Star field animations run smoothly on the practitioner's personal phone
7. All text content has been reviewed and approved by the client

10. Delivery & Deployment

10.1 Deployment Platform

- Hosting: Vercel (connected to GitHub repository for continuous deployment)
- Domain: Vercel free subdomain initially, optional custom domain later
- SSL: Automatic HTTPS via Vercel
- Deployment trigger: Push to main branch on GitHub

10.2 Deliverables

Deliverable	Description
Source code	Complete Next.js project in a GitHub repository
Live website	Deployed and accessible via Vercel URL
Cal.com configuration	3 event types configured with custom fields and Stripe integration
Setup documentation	Brief guide for the client on how to change availability, update prices, and access Stripe dashboard
This SRS document	Serves as the technical specification and acceptance reference

11. Revision History

Version	Date	Author	Changes
1.0	March 2026	[Developer Name]	Initial SRS document covering Phase 1 requirements and Phase 2 high-level scope
